

COLUMBIA RIVER ENVIRONMENTAL SENSITIVITY DATA METADATA

September 1996

**National Oceanic and Atmospheric Administration
Hazardous Materials Response and Assessment Division
7600 Sand Point Way, NE
Seattle, Washington 98115**

FILE DESCRIBES: Digital Environmental Sensitivity data for the Columbia River compiled by the National Oceanic and Atmospheric Administration, Seattle, Washington in 1996.

FILE CREATED BY: Renn Hanson
Field Investigator
Genwest Systems, Inc.
170 W. Dayton, Suite 201
Edmonds, WA 98020
Phone: (206) 771-2700
FAX: (206) 672-8471

FILE CREATED ON: 199609

COMMENTS: Information was developed using the U.S. Federal Geographic Data Committee's Content Standards for Digital Geospatial Metadata, June 8, 1994. The numbering scheme matches the Metadata Standard in order to facilitate referencing definitions of the elements. The items in **bold** are required elements and the others are optional elements. The Spatial Data Transfer Standard (SDTS), ver. 03/92, was referenced to properly identify the geographic entities.

1.0. IDENTIFICATION INFORMATION

1.1. CITATION

1.1.1. ORIGINATOR:

National Oceanic and Atmospheric Administration (NOAA), Office of Ocean Resources Conservation and Assessment, Hazardous Materials Response and Assessment Division, Seattle, Washington 98115

1.1.2. PUBLICATION DATE:

199609

1.1.4. TITLE:

Columbia River—Environmental Sensitivity Data

1.1.5. EDITION:

First

1.1.6. GEOSPATIAL DATA PRESENTATION FORM:

Maps

1.1.7. SERIES INFORMATION

1.1.7.1. SERIES NAME:

None

1.1.7.2. ISSUE IDENTIFICATION:

Columbia River

1.1.8. PUBLICATION INFORMATION

1.1.8.1. PUBLICATION PLACE:

Seattle, Washington

1.1.8.2. PUBLISHER:

NOAA, Office of Ocean Resources Conservation and Assessment, Hazardous Materials Response and Assessment Division

1.1.9. OTHER CITATION DETAILS:

Prepared by the Hazardous Materials Response and Assessment Division, NOAA, Seattle, Washington for NOAA; U.S. Coast Guard, Seattle, Washington; ; U.S. Coast Guard, Portland, Oregon; Oregon Department of Fish and Wildlife; and Washington Department of Fish and Game.

1.1.11. LARGER WORK CITATION:

None

1.2. DESCRIPTION

1.2.1. ABSTRACT:

This data set comprises the Environmental Sensitivity Index (ESI) maps for the shoreline of the Columbia River. These data characterize coastal environments by their sensitivity to spilled oil. The data include information for shoreline habitats.

1.2.2. PURPOSE:

The data were collected, mapped, and digitized to provide environmental data for oil spill planning and response. The Clean Water Act with amendments by the Oil Pollution Act of 1990 requires response plans for immediate and effective protection of sensitive resources

1.3. TIME PERIOD OF CONTENT

1.3.1. TIME PERIOD INFORMATION

1.3.1.3. RANGE OF DATES/TIMES:

The intertidal habitats were designated using data from the Oregon Department of Energy, the National Wetlands Inventory and the U.S. Army Corps of Engineers Inventory of Riparian Habitats. The dates for these data vary and are documented in Section 2.5.1

1.4. STATUS

1.4.1. PROGRESS:

Complete

1.4.2. MAINTENANCE AND UPDATE FREQUENCY:

None planned

1.5. SPATIAL DOMAIN

1.5.1. BOUNDING COORDINATES

1.5.1.1. WEST BOUNDING COORDINATE:

-124.09°

1.5.1.2. EAST BOUNDING COORDINATE:

-120.63°

1.5.1.3. NORTH BOUNDING COORDINATE:

46.40°

1.5.1.4. SOUTH BOUNDING COORDINATE:

45.50°

1.6 KEYWORDS

1.6.1. THEME

1.6.1.1. THEME KEYWORD THESAURUS:

None

1.6.1.2. THEME KEYWORD:

Sensitivity maps; ESI; coastal resources; oil spill planning;
and coastal zone management

1.6.2. PLACE

1.6.2.1. THESAURUS:

None

1.6.2.2. PLACE KEYWORD:

Columbia River

1.7. ACCESS CONSTRAINTS:

None

1.8. USE CONSTRAINTS:

DO NOT USE ESI MAPS FOR NAVIGATIONAL PURPOSES.

Besides the above warning, there are no use constraints on this data.

Acknowledgment of NOAA and other contributing sources would be appreciated in products derived from these data.

1.11. DATA SET CREDIT:

This project was supported by NOAA's Hazardous Materials Response and Assessment Division, Robert Pavia, Project Manager.

Shoreline and habitat data were digitized by Marine Spill Response Corporation (MSRC).

Research Planning, Inc. provided overlays and guidance to MSRC for the habitat digitization.

Data were processed by NOAA to derive a topologically clean data set and assign additional shoreline attributes.

Genwest Systems, Inc. checked the shoreline types against the hard copy atlas.

Review of the hard copy maps was performed by Carol Shuler, Dell Simmons and Curtis L. Burly (U.S. Fish and Wildlife Service); Jim Oberladen and Dick Logan (Washington Department of Ecology); Bruce Sutherland (Oregon Department of Environmental Quality); Greg Robart, Joe Pesek, Jim Torland and Jim Newton (Oregon Department of Fish and Wildlife); Don Haring (Washington Department of Fisheries); Geoffrey Dorsey (U.S. Army Corps of Engineers); and Sharon Christopherson (NOAA).

2.0. DATA QUALITY INFORMATION

2.1. ATTRIBUTE ACCURACY

2.1.1. ATTRIBUTE ACCURACY REPORT:

The attribute accuracy is estimated to be “good” given the years of ESI experience, the data input methodology, the quality control review sessions, and the digital logical consistency checks. There has been no quantitative accuracy assessment.

2.2. LOGICAL CONSISTENCY REPORT:

The data were originally digitized by MSRC using a CAD system. NOAA converted these data to ARC/INFO[®] coverages and cleaned up the data to obtain a topologically clean shoreline cover. Shoreline arcs were assigned a source_id to indicate whether the arc was retained from the MSRC data set, or whether they were extensions added to obtain closure. Additionally, arcs were assigned a line type based on whether they represented a shoreline, hydrography or pier feature. Polygons were assigned an attribute water_code to differentiate between land and water features. Using a series of algorithms and arcedit functions, arcs digitized in the ESI cover were matched to the shoreline and the ESI value was transferred to the corresponding segment of the shoreline cover. In dealing with polygonal features such as flats and marshes, arcs corresponding to the shoreline side were deleted and the actual shoreline was utilized instead. This is to insure that the shoreline presented in the ESI cover is a replica of the shoreline given in the hydro cover.

Data was run through a translator to an independent mapping program. The translator has checks that assure all data items are of the proper type and that they have a valid value assigned. Computerized maps were then compared to the hard copy atlases for correctness and completeness. Any discrepancies were corrected on the ARC/INFO[®] coverage. Final checks for topological correctness and data completeness were then performed.

2.3. COMPLETENESS REPORT:

The maps were intended to provide a regional overview of the environmentally sensitive shoreline habitats of the Columbia River.

Shoreline Habitat Mapping:

Prediction of the behavior and persistence of oil on intertidal habitats is based on an understanding of the dynamics of the coastal environments, not just the substrate type and grain size. The vulnerability of a particular intertidal habitat is an integration of the following factors:

- 1) Shoreline type (substrate, grain size, tidal elevation, origin)
- 2) Exposure to wave and tidal energy
- 3) Biological productivity and sensitivity
- 4) Ease of cleanup

All of these factors are used to determine the relative sensitivity of intertidal habitats. Key to the sensitivity ranking is an understanding of the relationships between: physical processes; substrate; shoreline type; product type; fate and effect; and sediment transport patterns. The intensity of energy expended upon a shoreline by wave action, tidal currents, and river currents directly affects the persistence of stranded oil. The need for shoreline cleanup activities is determined, in part, by the slowness of natural processes in removal of oil stranded on the shoreline.

These concepts have been used in the development of the ESI, which ranks shoreline environments as to their relative sensitivity to oil spills, potential biological injury, and ease of cleanup. Generally speaking, areas exposed to high levels of physical energy, such as wave action and tidal currents, and low biological activity rank low on the scale, whereas sheltered areas with associated high biological activity have the highest ranking.

2.4. POSITIONAL ACCURACY

2.4.1. HORIZONTAL POSITIONAL ACCURACY

2.4.1.1. HORIZONTAL POSITIONAL ACCURACY REPORT:

The ESI data uses USGS 1:24,000 topographic quadrangles as the base map. It is estimated that the ESI has a minimum mapping unit of 50 feet.

5.0. ENTITY AND ATTRIBUTE INFORMATION

5.1. DETAILED DESCRIPTION: ESI

The Coverage ESI contains polygonal (GT-Polygons) and arc (Complete Chains) features for the ESI shoreline classification. The classification of the features is based upon *Guidelines for Developing Digital Environmental Sensitivity Index Atlases and Data-bases* (Michel, J. and J. Dahlin, 1993, Hazardous Materials Response and Assessment Division, NOAA). The ESI classification was performed in 1991.
